

Zomato UX Case Study

Introduction

Zomato is the leading food delivery application in India. It connects millions of consumers with eateries to both eat and get things delivered. Its restaurant net has a great number of reviews, the ordering process is well-developed, and new functions are available.

User Journey Analysis

Journey Stages:

- Discovery: The user opens the application and searches restaurants or cuisines.
- Exploration: Web user navigates the options and reads the ratings and reviews.
- Selection: User chooses a restaurant or dish, vehemently goes through the menu and modifies the order when necessary.
- Checkout: Customer enters an address and payment method, reviews the bill and orders it.
- Tracking/Delivery: User monitors the live status, receives notifications and confirms that the food has reached.

Strengths:

- Instant registration and intelligent suggestions.
- A plethora of content, menus, reviews, ratings and pictures.
- Convenient navigation and ordering.
- real time order tracking and notifications.
- social evidence such as Friends recommend and trending selections.

Weaknesses:

- Overload of too many choices available in urban areas can be frustrating to the user.
- There is no clarity or consistency of delivery time and fee messages.
- There are poor sort and search options in the list of favorites.
- The app cannot ensure that special instructions or allergies are checked very fast.
- The issue of security has been increasing.

Recommendations + Description of Wireframes Sketches.

Improvement 1: More Favorite Restaurants Filter.

Include a sort or search bar within the favorite list of the user to enable him or her to locate a given cuisine or dish.

Wireframe Sketch:

- Top: Find dish in favorites search box.
- Below: Cuisine and rating filter.
- List: This is a list with only favorite restaurants and no pictures, only name boxes.

Improvement 2: Confirmation of Instructions orders.

As a user is adding information such as allergies or utensil preferences, display an immediate response of the restaurant or the application rather than delivery time.

Wireframe Sketch:

- Order summary page: add the word Special instructions received with a green check.
- Notification area: display a message such as Restaurant successfully received your allergy notification / cutlery request.

Recommendation 3: Disclosed Breakdown of Fees Up-Front.

Present a distinct, one at a time, list of all the fees prior to payment to prevent last-minute shock and reduced cart abandonment.

Wireframe Sketch:

- Prior to payment: large box bearing the title of Fee Details.
- Food total, delivery fee, service fee, packaging fee, any promo and final total lines.
- Underneath has clear proceed button.

Well-known Wireframe/Mockup Descriptions.

(Draw simple boxes, titles, and labels.)

- Preferred Filter Screen: Header: with search/filters and then a simple list of restaurants.

- Orders Instructions Confirmation: the confirmation of area of order and a little green tick to confirm instructions and a pop-up message.
- Fee Breakdown: A card on which we can see all fees and the final price before the pay button.

Conclusion

Zomato is doing well in restaurant discovery, is rich in content and personalized experiences, and also in tracking orders. Sharpening filters, making communication more straightforward and fees more visible will just make the users happier and ensure their continued visits.
